

Where to begin?

1. Read the [documentation](#), completely, from beginning to end to get the general idea about testRigor's capabilities. There is no way to remember everything completely, so don't focus on doing so, documentation is always there if you need it (you will need it).
2. Learn how to inspect web-pages(HTML). This [video](#) is enough to learn the basics.
3. Create a free account on [testRigor](#) and play around with it. Create a test suite, inside it create test cases to test any web-site of your choice. Click some buttons, open some links etc. Try everything that comes into your mind.

Now that you have some basic knowledge and experience with testRigor it's time to make something more formal. Below are the steps for you to follow and create a few test cases for your portfolio. Preconditions: create a new test suite with "https://www.amazon.com" as URL to run tests on.

Test Case 1:

1. Go to "Sign in" tab
2. Go to "Create account" tab
3. Fill in email, password and re-enter password fields with incorrect credentials
4. Submit the form
5. Check that error messages below your name, email, password and re-enter password fields is shown
6. Fill in your name, password and re-enter password fields with correct credentials
7. Submit the form
8. Check that error messages below your name, password and re-enter password fields is not shown
9. Check that error messages below your email is shown

Test Case 2:

1. Find Alexa link on the page
2. Click Alexa
3. Check that page contains End of Service Notice
4. Return to the previous page
5. Search for headphones
6. Grab names of first two items (search results) and save them into variables
7. Search for PC
8. Check that page does not contain previously saved values
